

APSU '16

Alumni platform with a private member portal, event payments and moderated community content

CLIENT
APSU '16

ROLE
Design, full-stack build, security, deployment

TIMELINE
2026 – ongoing

LIVE
apsu16.com

A home for the Class of 2016 of St. Augustine's College, Cape Coast. The public site tells the year group's story and gives every member a house to belong to. Behind it, a private portal lets verified members find each other, RSVP to events, pay dues and post updates. The association's executives run the site themselves: they edit content, review submissions and track who is attending.

263

verified members

22%

less JavaScript per public page (352 kB down to at most 275 kB)

10

house pages, one for each school house

The challenge

- More than 250 members needed a private place to find each other, but the member list had to stay hidden from the public.
- Events needed RSVPs where members choose options and pay straight away through the association's existing payment drive.
- Executives needed to review honours nominations and member updates without asking a developer.
- Most members use phones on slow mobile connections, so every page had to be light and fast.

Key features

01

Private member portal

A member directory, events, dues, profile and messages in one place, designed for phones first.

02

Event RSVPs with options

Members tick the items they want and see the total. The server sets the price, then hands off to GroupFund to pay.

03

Honours and class notes

Members nominate brothers for awards and post updates. Executives review both in the app and members are notified.

04

Self-service content

Admins change the site's text and images themselves. Every admin action goes into an audit log.

05

Opening animation

Particles burst like fireworks and form the wordmark. Plays once per visitor, with a reduced-motion fallback.

06

Ten houses

Each school house has its own page, so every member belongs to a smaller group within the year.

07

Passwordless sign-in

Members sign in with a one-time code sent by email. The membership check runs on the server, with rate limiting.

08

Attendee lists

Admins see who confirmed and what each person chose, then export the list to a spreadsheet.

Houses: every member belongs to one of ten (member photos blurred)

Projects and upcoming events

What I built

- A public site and a separate member portal. Members sign in with a one-time code, and access rules in the database protect member data.
- Event packages with selectable options. The server calculates the total and sends the member to the existing GroupFund payment drive.
- Admin panels for nominations, class notes, events and site content, with in-app notifications and an audit log.
- A redesign that cut the JavaScript on every public page, plus a full security hardening pass.

Honours: the year group's awards and nominations

Opening animation: particles form the wordmark

Member sign-in with a one-time code

— Security & quality

- Row-level security on member data. Sensitive database functions run on the server only.
- Payment amounts calculated on the server. The browser only sends which package was chosen.
- Membership lookups moved into a rate-limited server route, to stop scripted email checks.
- Uploads checked by file contents, not file name. Spreadsheet exports guarded against formula injection.
- Security headers (CSP, HSTS, no framing) and error monitoring with Sentry.
