What needed solving

- 01** Every guest had to register and contribute at least GHS 200 before receiving an entry pass.
- 02** The organisers needed a paid VIP tier with a hard limit of 50 places and upgrades for existing guests.
- 03** Guests' personal data had to be protected properly, not just stored.
- 04** The organising team needed to change website text, seat guests and email guests without a developer.

Built end to end

01 Registration and contribution gate

02 Paystack payments

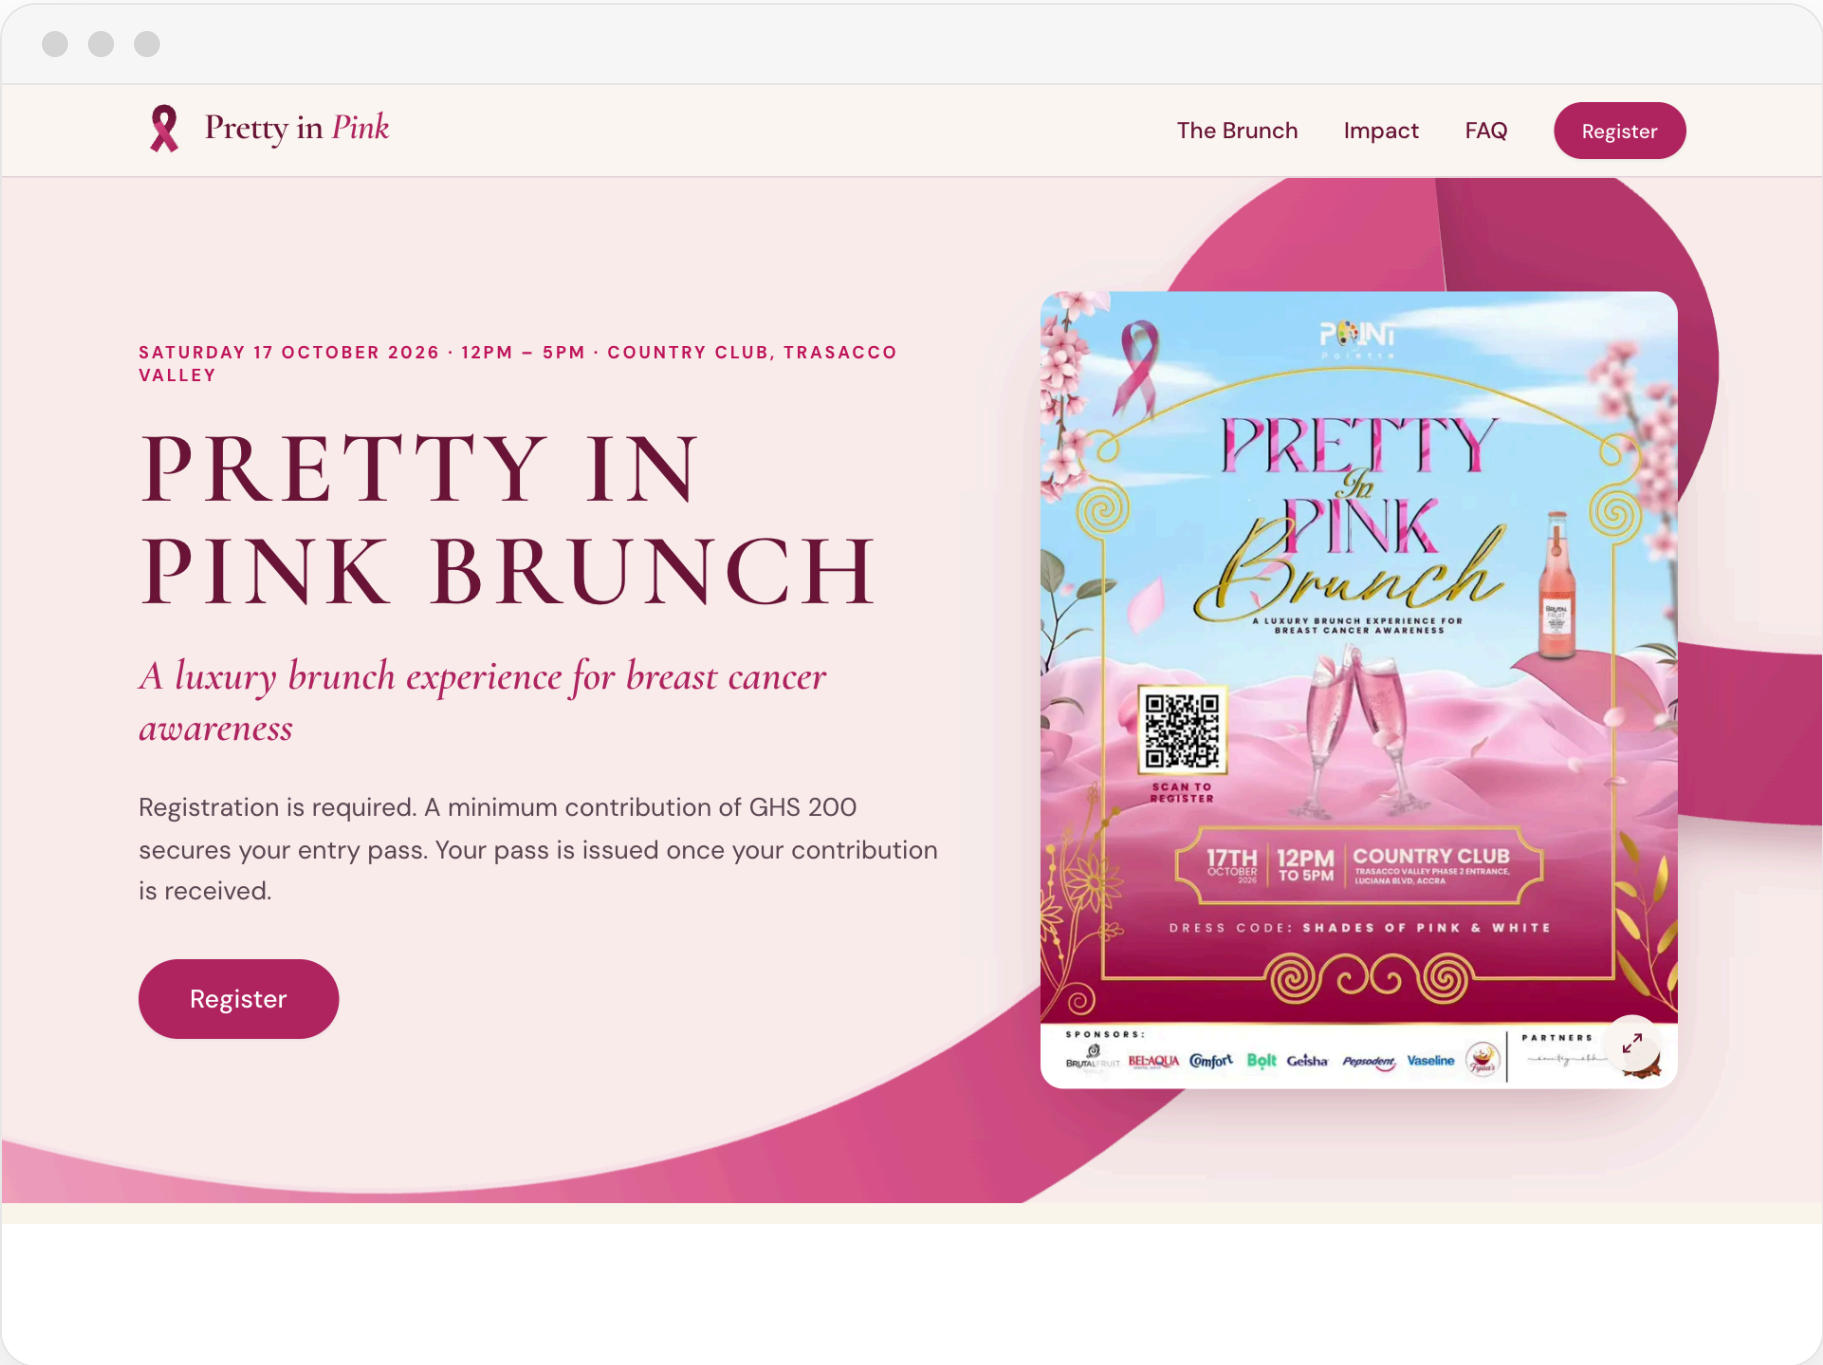

03 Paid VIP tier

04 Digital QR passes

05 Door check-in

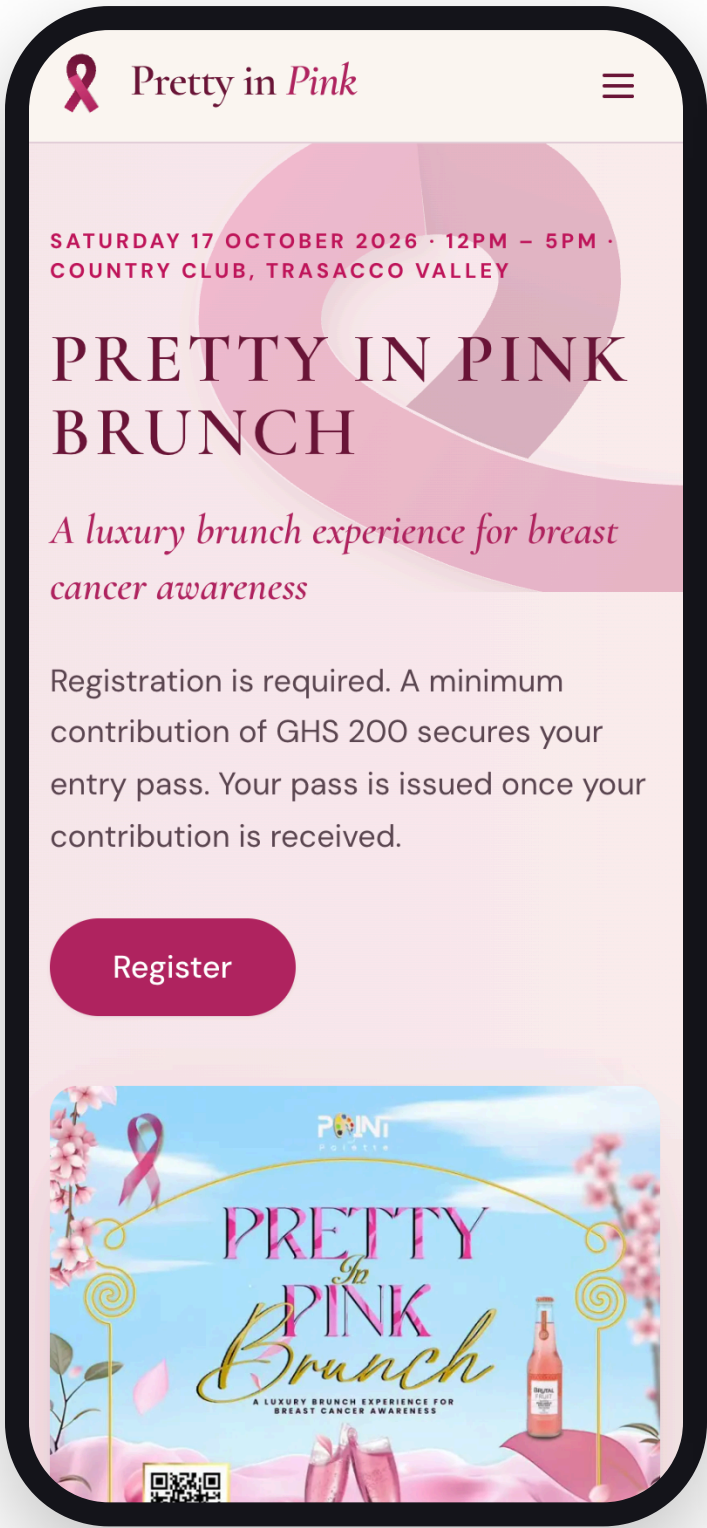

06 Seating and tracking links

Admin: guest list with masked contact details (sample data)

Built to be trusted

- 01** Personal data encrypted with AES-256-GCM, with keyed hashes for searching without decrypting.
- 02** Staff roles enforced in every API route and by database access rules; admins must use an authenticator app to sign in.
- 03** Contact details masked by default, every reveal recorded in an audit log, staff screens watermarked, and idle sessions signed out automatically.
- 04** Strict security headers (CSP and HSTS) and rate limiting on public forms.
- 05** 291 automated tests; type checks and a full build must pass before every release.
